

💖 Crush Compatibility Checker

Imagine you are building a small Java program that checks how strong someone's "crush compatibility" is based on a few fun parameters.

The program should ask the user for:

- Name
- Age
- Confidence Level (1–10)
- Effort Level (1–10)
- Number of replies received today

Rules

1. If the user's age is below 18:
2. Display: **"Focus on studies first!"**
3. Do not calculate the compatibility score.
4. If the age is 18 or above:
5. Start the compatibility score from .
6. Check Confidence:
7. If confidence is or more, increase the compatibility score by .
8. Otherwise, display that confidence is low.
9. Check Effort:
10. If effort is or more, increase the compatibility score by .
11. Otherwise, display that effort is low.
12. Check Replies:
13. If replies are or more, increase the score by .
14. If replies are between and , increase the score by .
15. Otherwise, display that the person is probably being ignored. 😞

16. Display the final compatibility score.

Final Result

Based on the score:

- Score → "LEGENDARY MATCH!"
- Score → "GOOD MATCH!"
- Score → "RISKY MATCH!"
- Score → "SINGLE MODE!"

Bonus Feature — Next Move

After displaying the result, show a menu:

1. Send Message
2. Wait for Reply
3. Move On

Use to handle the user's choice.

- If is selected:
 - Send a message.
 - Increase the number of replies/messages using the increment operator.
- If is selected:
 - Display a waiting message.
 - Decrease the patience/reply count using the decrement operator.
- If is selected:
 - Display a funny "Moving On" message.

For any other choice, display:

"Invalid choice!"

Concepts to Practice

Try to solve this problem using the concepts you have learned:

- Variables
- Data Types

- Scanner
- Arithmetic Operators
- Relational Operators
- Increment (++)
- Decrement (--)
- if
- if-else
- else-if
- Nested Conditions
- switch-case
- break

Challenge: Try to make the program without looking at a solution. First create the logic on paper, then write the Java code.
